Risk factors for upstaging from DCIS to invasive cancer in final surgical specimen	
	Oxford
	LoE
Higher risk	
▪ DCIS without microcalcification in core needle or vacuum biopsy	3b
▪ Microcalcification $\geq 11,5$ mm	3b
▪ Presentation as tumor in MRI	3b
▪ Increased Ki-67 ($\geq 20\%$)	3b
▪ PR negative	3b
▪ High peak contrast enhancement on MRI	3b
▪ Irregularly shaped, non-circumscribed, heterogeneous or margin-enhancing tumors with intratumoral high signal intensity or peritumoral edema on MRI	3b
▪ Biopsy technique: diagnosis by core needle biopsy versus vacuum biopsy (smaller sampling volume)	3b
▪ High platelet-lymphocyte ratio	3b
Lower risk	
▪ Removal $\geq 90\%$ of the microcalcifications by vacuum biopsy	3b

Original Investigation

Breast Cancer Mortality After a Diagnosis of Ductal Carcinoma In Situ

Narod A. et al.: JAMA Oncol. 2015 Oct;1(7):888-96

- **108.196 patients from the SEER data base,**
- **retrospective analysis,**
- **breast cancer specific mortality 3,3 %,**
- **results:**
 - **risk is greater for young and black women,**
 - **the risk of dying from breast cancer is increased after ipsilateral invasive recurrence [HR 18.1 (95% CI 14.0-23.6); $P < 0.001$] or contralateral invasive recurrence [HR 13.8 (95% CI 11.5-16.6); $P < 0.001$], but not after a DCIS recurrence (ipsilateral or contralateral),**
 - **the use of radiotherapy reduced the risk of developing an ipsilateral invasive recurrence from 4.9% to 2.5% but did not reduce breast cancer-specific mortality at 10 years (0.9% vs 0.8%).**

Association of a Diagnosis of Ductal Carcinoma In Situ With Death From Breast Cancer

Giannakeas V, Sopik V, Narod SA. JAMA Netw Open. 2020 Sep 1;3(9):e2017124

- **144,524 women treated for DCIS, 1,540 women died of breast cancer,**
- **cohort study included data for women who had first primary DCIS diagnosed between 1995 and 2014 from the SEER registries database (use of ET is not reported),**
- **retrospective analysis,**
- **results:**
 - **standardized mortality ratio for death from breast cancer among women with DCIS was 3.36 (95% CI, 3.20-3.53),**
 - **risk is greater for young and black women,**
 - **4,502 (3.1%) ipsilateral invasive recurrences, resulting in a 20-year actuarial risk of 13.9%,**
 - **5,527 (3.8%) contralateral invasive breast cancers, resulting in a 20-year actuarial risk of 11.3%,**
 - **women with DCIS had a 3-fold increased risk of death from breast cancer compared to women without DCIS.**

1. Giannakeas V, Sopik V, Narod SA. et al. Association of a Diagnosis of Ductal Carcinoma In Situ With Death From Breast Cancer. JAMA Netw Open. 2020 Sep 1;3(9):e2017124. doi: 10.1001/jamanetworkopen.2020.17124.

Good Clinical Practice (GCP)

Surgical excision (BCS or mastectomy) is the standard treatment for DCIS.

Adjuvant treatment (radiotherapy, endocrine treatment) must be discussed with the patient individually. Adverse effects should be weighted against risk reduction.

DCIS Radiotherapy Statements

- Radiotherapy has no impact on survival LoE 1a
- Radiotherapy reduces the risk of ipsilateral (invasive and non invasive) recurrences by 50 % LoE 1a
- Avoidance of invasive recurrence is probably not associated with survival benefit LoE 2b
- The absolute (individual) benefit of radiotherapy depends on the individual risk of local recurrence
- The number needed to treat (for ipsilateral breast recurrence) is 9 (across all risk groups)

DCIS

Adjuvant Radiotherapy

	Oxford		
	LoE	GR	AGO
Radiotherapy after:			
▪ Breast conserving surgery (BCS)	1a	A	++
▪ Mastectomy	2b	B	--
Radiotherapy procedure:			
▪ Conventionally fractionated radiotherapy (50 Gy in 25 fract.)	1a	A	+
▪ Hypofractionated radiotherapy (40-42,5 Gy in 15-16 fract.)	1a	A	+
▪ Radiotherapy boost of the tumor bed	1b	B	+/-
▪ in case of risk factors* (absolute benefit 5-y-RFS 4%, rate of fibrosis significant increased)	1b ^a	B	+/-
▪ without risk factors	2b	B	-
▪ Partial breast irradiation [age ≥50y, DCIS ≤ 3 cm, G1-2, R0 (≥ 5 mm), unifocal/ unicentric]	1b	B	+

Side effects and disadvantages must be weighed against risk reduction. Omitting radiotherapy implies elevated risk for local recurrence without effect for overall survival even in the subset of „good risk“ patients. Lack of level-1 evidence supporting the omission of adjuvant radiotherapy in selected low-risk cases: < 2.5 cm, low and intermediate nuclear grade, mammographically detected
 * <50 years or ≥ 50 years and diagnosis based on symptoms, ≥ 15 mm, multifocality, palpable tumor, resection margins <10 mm, G2 / 3, central necrosis, comedo type
