## Association of a Diagnosis of Ductal Carcinoma In Situ With Death From Breast Cancer

Giannakeas V, Sopik V, Narod SA. JAMA Netw Open. 2020 Sep 1;3(9):e2017124

- **144,524 women treated for DCIS, 1,540 women died of breast cancer,**
- **cohort study included data for women who had first primary DCIS diagnosed between 1995 and 2014 from the SEER registries database (use of ET is not reported),**
- **retrospective analysis,**
- **results:**
  - **standardized mortality ratio for death from breast cancer among women with DCIS was 3.36 (95% CI, 3.20-3.53),**
  - **risk is greater for young and black women,**
  - **4,502 (3.1%) ipsilateral invasive recurrences, resulting in a 20-year actuarial risk of 13.9%,**
  - **5,527 (3.8%) contralateral invasive breast cancers, resulting in a 20-year actuarial risk of 11.3%,**
  - **women with DCIS had a 3-fold increased risk of death from breast cancer compared to women without DCIS.**

Risk Factors for Upstaging from DCIS to Invasive Cancer in Final Surgical Specimen	
	Oxford LoE
<b>Higher risk</b>	
▪ DCIS without microcalcification in core needle or vacuum biopsy	3b
▪ Microcalcification $\geq 11,5$ mm	3b
▪ Presentation as tumor in MRI	3b
▪ Increased KI-67 ( $\geq 20\%$ )	3b
▪ PR negative	3b
▪ High peak contrast enhancement on MRI	3b
▪ Irregularly shaped, non-circumscribed, heterogeneous or margin-enhancing tumors with intratumoral high signal intensity or peritumoral edema on MRI	3b
▪ Biopsy technique: diagnosis by core needle biopsy versus vacuum biopsy (smaller sampling volume)	3b
▪ High platelet-lymphocyte ratio	3b
<b>Lower risk</b>	
▪ Removal $\geq 90\%$ of the microcalcifications by vacuum biopsy	3b

## DCIS Radiotherapy Statements

---

- **Radiotherapy has no impact on survival**
- **Radiotherapy reduces the risk of ipsilateral (invasive and non invasive) recurrences by 50 %**
- **The number needed to treat (for ipsilateral breast recurrence) is 9 (over all risk groups).**

## Adjuvant Radiotherapy

### Radiotherapy after:

- Breast conserving surgery (BCS)
- Mastectomy

### Radiotherapy procedure:

- Conventionally fractionated radiotherapy (50 Gy in 25 fract.)
- Hypofractionated radiotherapy (40-42,5 Gy in 15-16 fract.)
- Radiotherapy boost of the tumor bed
  - in case of risk factors\* (absolute benefit 5-y-RFS 4 %, rate of fibrosis significant increased)
  - without risk factors
- Partial breast irradiation [age ≥ 50y, DCIS ≤ 3 cm, G1-2, R0 (≥ 5 mm), unifocal / unicentric]

1b	B	+	

Side effects and disadvantages must be weighed against risk reduction. Omitting radiotherapy implies elevated risk for local recurrence without effect for overall survival even in the subset of „good risk“ patients. Lack of level-1 evidence supporting the omission of adjuvant radiotherapy in selected low-risk cases: < 2.5 cm, low and intermediate nuclear grade, mammographically detected.

\* < 50 years or ≥ 50 years and diagnosis based on symptoms, ≥ 15 mm, multifocality, palpable tumor, resection margins < 10 mm, G2 / 3, central necrosis, comedo type

## DCIS – Adjuvant Systemic Treatment

■	Adjuvant endocrine treatment has no impact on survival	LoE 1a
■	Endocrine treatment may have a small effect on ipsilateral invasive and DCIS recurrences	LoE 1a
■	Endocrine treatment for DCIS has an effect on contralateral invasive and non-invasive cancer	LoE 1a
■	The number needed to treat for any ipsilateral breast event is 15	LoE 1a
■	The number needed to treat to prevent invasive breast cancer is 29 for anastrozole vs. 59 for tamoxifen*	LoE 1b
